I am teaching PHYSICS 95.

This course will concentrate on introducing the student to contemporary physics research and on teaching research skills, including reading, writing and talking about physics. This will help students have an idea of possible interesting areas of research. It also aims to provide an overview of the interesting questions still unanswered in each field. There are two sessions per week. One in which physics department faculty give short presentations on their work and answer questions, the other in which the students give short presentations highlighting their recently learned research and communication skills. There is no final exam but a final presentation. Dinner and ice cream/frozen yoghurt are involved weekly. Please come and shop this class. It starts this Wednesday September 5 at 7:30 pm in Jefferson 453.
